Nike/Converse

To whom it may concern,

I am Austin Tran, a current undergraduate student studying Computer Science and Engineering at UC Irvine. I am writing regarding the technology internships that have opened recently. I am looking for an internship that can expand my horizons and explore what is available to me in the real world, and I am very interested specifically in technology roles at Nike and Converse after coming to the University Recruiting Event. The laid back nature of Nike and Converse has really drawn to me the company.

Pursing a Bachelor's degree in Computer Science and Engineering has allowed me to see a variety of different kinds of ways software can be used simply at home to automate tasks, make games, make a variety of programs, analyze data, etc. I have also studied data structures and algorithms on my own time, something I know is fundamental to software related areas. I believe that I have the skills to bring to Nike in that I have analyzed economic data to find the impact of COVID-19 on different parts of the world using Python, and I have created a variety of different projects. As for my lab research, I have also helped my professors and mentors analyze data coming from CT images and other radiology imaging with Python which I believe gives me a unique skillset.

I would love to take my skills to the next level and see what I can do for Nike and Converse as I explore what I can do with my skills. I have owned shoes from both for all my life and wear them all the time (specifically dunks and chucks), I would love to work somewhere I can identify with.

Thank you for your time,
Austin Tran
